CyberGIS-Jupyter for Sustainable and Reproducible Geospatial Analytics Anand Padmanabhan, Alexander Michels, Shaohua Wang, and Shaowen Wang

<u>Goal</u>: Implement a scalable platform that conduct sustainable and reproducible geospatial analytics.

CyberGIS-Jupyter

CyberGIS-Jupyter is an innovative cyberGIS framework for achieving data-intensive, sustainable, reproducible, and scalable geospatial analytics using Jupyter Notebook.

Capabilities

- Provides notebook servers with cyberGIS libraries and many geospatial software packages installed
 - Built-in cyberGIS capabilities to accelerate gateway application development

Purposes

- Achieves data-intensive, reproducible, and scalable geospatial analytics using Jupyter Notebooks
 - Provides a holistic solution
 - Makes sharing codes and workflows easy
- Perform sustainable geospatial research
 - Cloud Native GIS (DockerSwarm/Kubernetes)
- Reduces the barrier to accessing advanced cyberinfrastructure and cyberGIS capabilities
 - Exploits JupyterHub, cloud and high performance computing resources

Use Floret to Visualize Geospatial Data

Geovisualization

- Interactive map generation inside notebooks
- Support multiple formats of geospatial data
- Layer management, transparency and styles
- E.g., HAND Application
- Geospatial data, analytics, algorithms, and workflow runtime environments are encapsulated into application packages
- Deployment can be elastically scaled to accommodate the computational needs of cyberGIS users
 - Straightforward management and maintenance of computational infrastructure
 - Seamless scaling between Virtual ROGER and XSEDE JetStream

Architecture and Implementation

HPC and Cloud Resources

- Virtual ROGER
 - HPC
 - VMWare Cloud
- XSEDE
 - Jetstream
 - Comet
- Architecture layers User layer
 - Application layer
 - Cloud resources
 - HPC resources

Data/storage synchronization

CyberGIS-Jupyter Technologies

file system allows data to be persisted between CyberGIS libraries sessions

Architecture of Docker Swarm CyberGIS-Jupyter Deployment

Architecture of Kubernetes CyberGIS-Jupyter Deployment

Case Studies and Results

Map Flood Inundation at Continental Scale

Calculate Height Above Nearest Drainage (HAND) at 10m for continental US

Flood analysis map derived from 10m USGS 3DEP national elevation dataset (180 billion cells) and National Hydrography Dataset (2.67 million stream reaches, raw data size: 5.2TB)

AAG-UCGIS Summer School

- Week-long summer school on Reproducible Problem Solving with CyberGIS and Geospatial Data Science
- Held between July 8 and 13, 2019 at CyberGIS Center at UIUC
- Over 35 students and 10 mentors engaged for intensive problem solving using CyberGIS-Jupyter

User Interface

* 🗢 🚔 * 🛆 🗉 🛸 🔍

CyberGIS-Jupyter Login Page

HAND Notebook in CyberGIS-Jupyter

<u>Goals</u>

- Collaborative methodology development
- Scalable data analytics
- Deliver methodology and data products to different user communities
 - Collaborators
 - Researchers
 - Decision makers
 - Students

Over 50 Jupyter notebooks were simultaneous running as docker container using a distributed computing infrastructure

Summer School students presenting their work using CyberGIS-Jupyter

Concluding Discussion

- Ability to bridge a local cyberinfrastructure with XSEDE
- CyberGIS-Jupyter demonstrated ability to support reproducible problem solving at scale
- Provides a valuable educational environment
- Kubernetes-based deployment has been developed and is being tested to support automatic scaling
